How this data is checked:

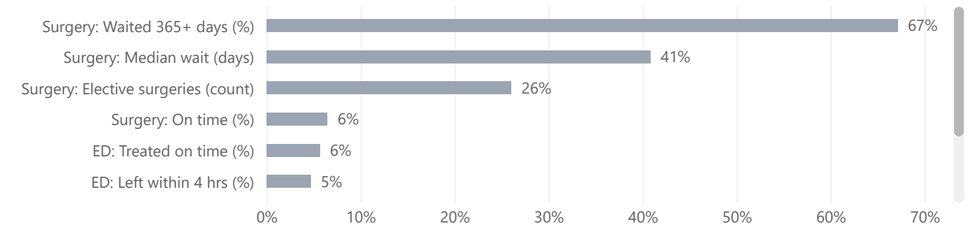

Every Monday at 03:00 (AEST) the pipeline checks AIHW MyHospitals for updated data, extracts it, loads it into Postgres, rebuilds the dbt models and runs 23 automated tests. Results of every run are stored in an audit table.

This page shows the latest.

- Completeness: rows from the API = rows stored = rows in the model (three-way reconciliation).
- Integrity: no missing keys or duplicate rows, and every result links to a known hospital and measure.
- Validity: percentages are between 0 and 100, and suppressed values are blank.

How much of the data is unavailable?

Share of results suppressed (no value published)
